

SPECTRUM REPORT (Bluetooth)

Applicant: Red Bear Electronic (Shenzhen) Co Ltd

Address of Applicant: Rm 610, 6/F, Block B, JinYuan Building, 302 XiXiang Avenue,
Bao An District, Shenzhen, China

Equipment Under Test (EUT)

Product Name: BLE Module

Model No.: MB-N2, Nano2, Blend2

Applicable standards: ETSI EN 300 328 V1.9.1 (2015-02)

Date of sample receipt: November 23, 2016

Date of Test: November 23-25, 2016

Date of report issue: November 25, 2016

Test Result : PASS *

* In the configuration tested, the EUT detailed in this report complied with the standards specified above.

The CE mark as shown below can be used, under the responsibility of the manufacturer, after completion of an EC Declaration of Conformity and compliance with all relevant EC Directives. The protection requirements with respect to electromagnetic compatibility contained in Directive 1999/5/EC are considered.

Robinson Lo

Laboratory Manager

This report details the results of the testing carried out on one sample. The results contained in this test report do not relate to other samples of the same product and does not permit the use of the GTS product certification mark. The manufacturer should ensure that all products in series production are in conformity with the product sample detailed in this report.

This report may only be reproduced and distributed in full. If the product in this report is used in any configuration other than that detailed in the report, the manufacturer must ensure the new system complies with all relevant standards. Any mention of GTS or testing done by GTS in connection with, distribution or use of the product described in this report must be approved by GTS in writing. This document cannot be reproduced except in full, without prior written approval of the Company. Any unauthorized alteration, forgery or falsification of the content or appearance of this document is unlawful and offenders may be prosecuted to the fullest extent of the law. Unless otherwise stated the results shown in this test report refer only to the sample(s) tested and such sample(s) are retained for 90 days only.

Remark:

Tx: In this whole report Tx (or tx) means Transmitter.

Rx: In this whole report Rx (or rx) means Receiver.

Temperature (Uncertainty): ±1°C Humidity(Uncertainty): ±5%

Uncertainty: ± 3%(for DC and low frequency voltages)

N/A : Not applicable

5 General Information

5.1 Client Information

| | |
|----------------------------------|--|
| Applicant: | Red Bear Electronic (Shenzhen) Co Ltd |
| Address of Applicant: | Rm 610, 6/F, Block B, JinYuan Building, 302 XiXiang Avenue, Bao An District, Shenzhen, China |
| Manufacturer/Factory: | Red Bear Electronic (Shenzhen) Co Ltd |
| Address of Manufacturer/Factory: | Rm 610, 6/F, Block B, JinYuan Building, 302 XiXiang Avenue, Bao An District, Shenzhen, China |

5.2 General Description of EUT

| | |
|--|-------------------------------|
| Product Name: | BLE Module |
| Model No.: | MB-N2, Nano2, Blend2 |
| Test Model: | MB-N2 |
| <i>Remark: All above models are identical in the same PCB layout, interior structure and electrical circuits. The only difference is the model name and battery capacity for commercial purpose.</i> | |
| Operation Frequency: | 2402~2480MHz |
| Channel numbers: | 40 |
| Channel separation: | 2MHz |
| Modulation technology: | GFSK |
| Bluetooth Version: | V4.0 |
| Antenna Type: | Ceramic antenna |
| Antenna gain: | 1.3dBi (declare by Applicant) |
| Power Supply: | DC 3.3V |

| Operation Frequency each of channel | | | | | | | |
|-------------------------------------|-----------|---------|-----------|---------|-----------|---------|-----------|
| Channel | Frequency | Channel | Frequency | Channel | Frequency | Channel | Frequency |
| 1 | 2402MHz | 11 | 2422MHz | 21 | 2442MHz | 31 | 2462MHz |
| 2 | 2404MHz | 12 | 2424MHz | 22 | 2444MHz | 32 | 2464MHz |
| ⋮ | ⋮ | ⋮ | ⋮ | ⋮ | ⋮ | ⋮ | ⋮ |
| 9 | 2418MHz | 19 | 2438MHz | 29 | 2458MHz | 39 | 2478MHz |
| 10 | 2420MHz | 20 | 2440MHz | 30 | 2460MHz | 40 | 2480MHz |

The test frequencies are below:

| Channel | Frequency (MHz) |
|----------|-----------------|
| Lowest: | 2402 |
| Middle: | 2440 |
| Highest: | 2480 |

5.3 Test Facility

The test facility is recognized, certified, or accredited by the following organizations:

- **FCC —Registration No.: 600491**

Global United Technology Services Co., Ltd., Shenzhen EMC Laboratory has been registered and fully described in a report filed with the (FCC) Federal Communications Commission. The acceptance letter from the FCC is maintained in files. Registration 600491, June 22, 2016

- **Industry Canada (IC) —Registration No.: 9079A-2**

The 3m Semi-anechoic chamber of Global United Technology Services Co., Ltd. Has been Registered by Certification and Engineering Bureau of Industry Canada for radio equipment testing with Registration No.: 9079A-2, August 15, 2016.

5.4 Test Location

All tests were performed at:

Global United Technology Services Co., Ltd.

Address: No. 301-309, 3/F., Jinyuan Business Building, No.2, Laodong Industrial Zone, Xixiang Road, Baoan District, Shenzhen, Guangdong, China 518102

Tel: 0755-27798480

Fax: 0755-27798960

5.5 Description of Support Units

The EUT has been tested as an independent unit.

5.6 Deviation from Standards

None.

5.7 Abnormalities from Standard Conditions

None.

5.8 Other Information Requested by the Customer

None.

7 Radio Technical Specification in ETSI EN 300 328

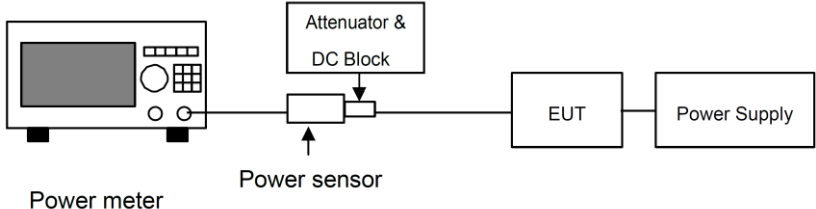

7.1 Test Environment and Mode

| Test mode: | | | |
|------------------------|------------------|--|-------|
| Transmitting mode: | | Keep the EUT in transmitting mode with modulation. | |
| Receiving mode | | Keep the EUT in receiving mode. | |
| Operating Environment: | | | |
| Item | Normal condition | Extreme condition | |
| | | NVHT | NVLT |
| Temperature | +25°C | +55°C | -10°C |
| Humidity | 20%-95% | | |
| Atmospheric Pressure: | 1008 mbar | | |

| Setting | Value |
|-------------------------------------|------------------|
| Modulation | Other (GFSK) |
| Adaptive | Yes |
| Number of Transmission Chains | 1 |
| Antenna Gain 1 | 1.3dBi |
| Nominal Channel Bandwidth | 1.2MHz |
| Maximum EIRP | -2.64dBm |
| DUT Frequency not configurable | No |
| Frequency Low | 2402MHz |
| Frequency Mid | 2440MHz |
| Frequency High | 2480MHz |
| Attenuation/Pathloss File 1 | Attenuator Port1 |
| DUT Port Occupied Channel Bandwidth | 1 |
| LBT/DAA Based | Yes |
| DUT Port Adaptivity | 1 |
| Channel Occupation Time | 13ms |

7.2 Transmitter Requirement

7.2.1 RF Output Power

| | |
|-------------------|--|
| Test Requirement: | ETSI EN 300 328 clause 4.3.2.2 |
| Test Method: | ETSI EN 300 328 clause 5.3.2.2.1.2 |
| Limit: | 20dBm |
| Test setup: |  <pre> graph LR PM[Power meter] --- PS[Power sensor] PS --- A[Attenuator & DC Block] A --- EUT[EUT] EUT --- PSUP[Power Supply] </pre> |
| Test procedure: | <p>Step 1:</p> <p>Use a fast power sensor suitable for 2,4 GHz and capable of 1 MS/s.</p> <p>Use the following settings:</p> <ul style="list-style-type: none"> - Sample speed 1 MS/s or faster. - The samples must represent the power of the signal. - Measurement duration: For non-adaptive equipment: equal to the observation period defined in clauses 4.3.1.3.2 or 4.3.2.4.2. For adaptive equipment, the measurement duration shall be long enough to ensure a minimum number of bursts (at least 10) are captured. <p>NOTE 1: For adaptive equipment, to increase the measurement accuracy, a higher number of bursts may be used.</p> <p>Step 2:</p> <p>For conducted measurements on devices with one transmit chain:</p> <ul style="list-style-type: none"> -Connect the power sensor to the transmit port, sample the transmit signal and store the raw data. Use these stored samples in all following steps. <p>For conducted measurements on devices with multiple transmit chains:</p> <ul style="list-style-type: none"> -Connect one power sensor to each transmit port for a synchronous measurement on all transmit ports. -Trigger the power sensors so that they start sampling at the same time. Make sure the time difference between the samples of all sensors is less than 500ns. -For each individual smpling point(time domain), sum the coincident power samples of all ports and store them. Use these summed samples in all following steps. <p>Step 3:</p> <p>Find the start and stop times of each burst in the stored measurement samples.</p> <p>The start and stop times are defined as the points where the power is at least 30 dB below the highest value of the stored samples in step 2.</p> |

| | |
|---------------------|--|
| | <p>NOTE 2: In case of insufficient dynamic range, the value of 30dB may need to be reduced appropriately.</p> <p>Step 4:</p> <p>Between the start and stop times of each individual burst calculate the RMS power over the burst using the formula below. Save these Pburst values, as well as the start and stop times for each burst.</p> $= \frac{1}{n} \sum_{i=1}^k P_i \quad ()$ <p>With "k" being the total number of samples and "n" the actual sample number</p> <p>Step 5:</p> <p>The highest of all Pburst values (value "A" in dBm) will be used for maximum e.i.r.p. calculations.</p> <p>Step 6:</p> <p>Add the (stated) antenna assembly gain "G" in dBi of the individual antenna.</p> <p>If applicable, add the additional beamforming gain "Y" in dB.</p> <p>If more than one antenna assembly is intended for this power setting, the maximum overall antenna gain (G or G + Y) shall be used.</p> <p>The RF Output Power (P) shall be calculated using the formula below:</p> $P = A + G + Y$ <p>Step 7:</p> <p>This value, which shall comply with the limit given in clause 4.3.1.2.3 or clause 4.3.2.2.3, shall be recorded in the test report.</p> |
| Measurement Record: | Uncertainty: $\pm 1.5\text{dB}$ |
| Test Instruments: | See section 6.0 |
| Test mode: | Transmitting mode |

Measurement Data

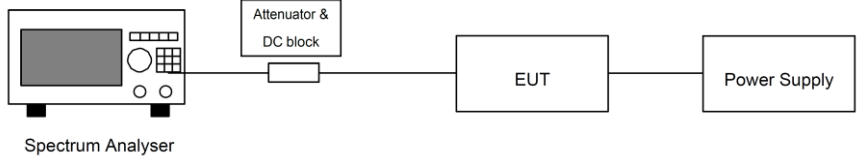

| Test conditions | Channel | Burst RMS power (dBm) | Antenna Gain(dBi) | Calculated Power (dBm) | Limit (dBm) | Result |
|-----------------|---------|-----------------------|-------------------|------------------------|-------------|--------|
| Normal | Lowest | -4.11 | 1.30 | -2.81 | 20 | Pass |
| | Middle | -4.18 | 1.30 | -2.88 | | |
| | Highest | -3.94 | 1.30 | -2.64 | | |
| NVHT | Lowest | -4.22 | 1.30 | -2.92 | | |

| | Highest | -4.01 | 1.30 | -2.71 | | |
| NVLT | Lowest | -4.14 | 1.30 | -2.84 | | |
| | Middle | -4.19 | 1.30 | -2.89 | | |
| | Highest | -3.98 | 1.30 | -2.68 | | |

Remark:

1>. Volt= Voltage, Temp= Temperature

2>. Antenna Gain=1.30dBi

7.2.1 Power Spectral Density

| | |
|-------------------|---|
| Test Requirement: | ETSI EN 300 328 clause 4.3.2.3 |
| Test Method: | ETSI EN 300 328 clause 5.3.3.2.1 |
| Limit: | 10dBm/MHz |
| Test setup: |  <p style="text-align: center;">Spectrum Analyser Attenuator & DC block EUT Power Supply</p> |
| Test procedure: | <p>Step 1:</p> <p>Connect the UUT to the spectrum analyser and use the following settings:</p> <p>Start Frequency: 2400 MHz Stop Frequency: 2483.5 MHz Resolution BW: 10 kHz Video BW: 30 kHz Sweep Points: > 8350</p> <p>NOTE: For spectrum analysers not supporting this number of sweep points, the frequency band may be segmented.</p> <p>Detector: RMS Trace Mode: Max Hold Sweep time: 10s; the sweep time may be increased further until a value where the sweep time has no impact on the RMS value of the signal</p> <p>For non-continuous signals, wait for the trace to stabilize. Save the (trace data) set to a file.</p> <p>Step 2:</p> <p>For conducted measurements on smart antenna systems using either operating mode 2 or 3 (see clause 5.1.3.2), repeat the measurement for each of the transmit ports. For each sampling point(frequency domain) , add up the coincident power values(in mW) for the different transmit chains and use this as the new data set.</p> <p>Step 3:</p> <p>Add up the values for power for all the samples in the file using the formula below.</p> $= \sum_{i=1}^k ()$ <p>With “k” being the total number of samples and “n” the actual sample Number.</p> <p>Step 4:</p> |

| | |
|---------------------|---|
| | <p>Normalize the individual values for power(in dBm) so that the sum is equal to the RF output Power (e.i.r.p.) measured in clause 5.3.2 and save the corrected data. The following formulas can be used:</p> <p>With "n" being the actual sample number</p> <p>Step 5:</p> <p>Starting from the first sample in the file (lowest frequency), add up the power(in mW) of the following samples representing a 1 MHz segment and record the results for power and position (i.e. sample #1 to #100). This is the Power Spectral Density (e.i.r.p.) for the first 1 MHz segment which shall be recorded.</p> <p>Step 6:</p> <p>Shift the start point of the samples added up in step 5 by one sample and repeat the procedure in step 5 (i.e. sample #2 to #101).</p> <p>Step 7:</p> <p>Repeat step 6 until the end of the data set and record the Power Spectral Density values for each of the 1 MHz segments.</p> <p>Step 8:</p> <p>From all the recorded results, the highest value is the maximum Power Spectral Density for the UUT. This value, which shall comply with the limit given in clause 4.3.2.3.3, shall be recorded in the test report.</p> |
| Measurement Record: | Uncertainty: $\pm 3\text{dB}$ |
| Test Instruments: | See section 6.0 |
| Test mode: | Transmitting mode |

Measurement Data

| Bluetooth mode | | | |
|----------------|----------------------------------|-----------------|--------|
| Channel | Power Spectral Density (dBm/MHz) | Limit (dBm/MHz) | Result |
| Lowest | -4.78 | 10.00 | Pass |
| Middle | -4.41 | | |
| Highest | -4.27 | | |

Lowest Channel

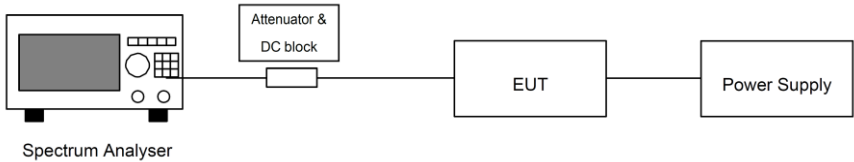

Middle Channel

Highest Channel

7.2.2 Occupied Channel Bandwidth

| | | | | | | | | | | | | | | | | | |
|---|--|-------------------|--|----------------|---|-----------|---------|---|--|--|--|----------------|-----|-------------|----------|-------------|-----|
| Test Requirement: | ETSI EN 300 328 clause 4.3.2.7 | | | | | | | | | | | | | | | | |
| Limit: | <p>The Occupied Channel Bandwidth for each hopping frequency shall fall completely within the band 2400MHz ~ 2483.5MHz.</p> <p>For non-adaptive Frequency Hopping equipment with e.i.r.p greater than 10 dBm, the Occupied Channel Bandwidth for every occupied hopping frequency shall be equal to or less than the value declared by the supplier. This declared value shall not be greater than 5 MHz.</p> | | | | | | | | | | | | | | | | |
| Test setup: |  <pre> graph LR SA[Spectrum Analyser] --- A[Attenuator & DC block] A --- EUT[EUT] EUT --- PS[Power Supply] </pre> | | | | | | | | | | | | | | | | |
| Test Procedure: | <p>Step 1:</p> <p>Connect the UUT to the spectrum analyser and use the following settings:</p> <table> <tr> <td>Centre Frequency:</td><td>The centre frequency of the channel under test</td></tr> <tr> <td>Resolution BW:</td><td>~ 1 % of the span without going below 1 %</td></tr> <tr> <td>Video BW:</td><td>3 × RBW</td></tr> <tr> <td>Frequency Span for frequency hopping equipment:</td><td>Lowest frequency separation that is used within the hopping sequence</td></tr> <tr> <td>Frequency Span for other types of equipment:</td><td>2 × Nominal Channel Bandwidth (e.g. 40 MHz for a 20 MHz channel)</td></tr> <tr> <td>Detector Mode:</td><td>RMS</td></tr> <tr> <td>Trace mode:</td><td>Max Hold</td></tr> <tr> <td>Sweep time:</td><td>1 s</td></tr> </table> <p>Step 2:</p> <p>Wait for the trace to stabilize.</p> <p>Find the peak value of the trace and place the analyser marker on this peak.</p> <p>Step 3:</p> <p>Use the 99 % bandwidth function of the spectrum analyser to measure the Occupied Channel Bandwidth of the UUT. This value shall be recorded.</p> <p>NOTE: Make sure that the power envelope is sufficiently above the noise floor of the analyser to avoid the noise signals left and right from the power envelope being taken into account by this measurement.</p> | Centre Frequency: | The centre frequency of the channel under test | Resolution BW: | ~ 1 % of the span without going below 1 % | Video BW: | 3 × RBW | Frequency Span for frequency hopping equipment: | Lowest frequency separation that is used within the hopping sequence | Frequency Span for other types of equipment: | 2 × Nominal Channel Bandwidth (e.g. 40 MHz for a 20 MHz channel) | Detector Mode: | RMS | Trace mode: | Max Hold | Sweep time: | 1 s |
| Centre Frequency: | The centre frequency of the channel under test | | | | | | | | | | | | | | | | |
| Resolution BW: | ~ 1 % of the span without going below 1 % | | | | | | | | | | | | | | | | |
| Video BW: | 3 × RBW | | | | | | | | | | | | | | | | |
| Frequency Span for frequency hopping equipment: | Lowest frequency separation that is used within the hopping sequence | | | | | | | | | | | | | | | | |
| Frequency Span for other types of equipment: | 2 × Nominal Channel Bandwidth (e.g. 40 MHz for a 20 MHz channel) | | | | | | | | | | | | | | | | |

| Lowest | 1.018 | 1.2 | 2401.50 | 2400MHz ~ 2483.5MHz | Pass |
| Highest | 1.019 | 1.2 | 2480.51 | | Pass |

Test plots are below:

7.2.3 Transmitter unwanted emissions in the OOB domain

| | |
|-------------------|---|
| Test Requirement: | ETSI EN 300 328 clause 4.3.2.8 |
| Test Method: | ETSI EN 300 328 clause 5.3.9.2 |
| Limit: | <p>The transmitter unwanted emissions in the out-of-band domain but outside the allocated band, shall not exceed the values provided by the mask in figure 3.</p> <p>A: -10 dBm/MHz e.i.r.p. B: -20 dBm/MHz e.i.r.p. C: Spurious Domain limits</p> <p>BW = Occupied Channel Bandwidth in MHz or 1 MHz whichever is greater</p> <p>Figure 3: Transmit mask</p> |
| Test setup: | <p>Spectrum Analyser</p> <p>Attenuator & DC block</p> <p>EUT</p> <p>Power Supply</p> |
| Test procedure: | <p>The applicable mask is defined by the measurement results from the tests performed under clause 5.3.8 (Occupied Channel Bandwidth).</p> <p>The Out-of-band emissions within the different horizontal segments of the mask provided in figures 1 and 3 shall be measured using the steps below. This method assumes the spectrum analyser is equipped with the Time Domain Power option.</p> <p>Step 1:</p> <p>Connect the UUT to the spectrum analyser and use the following settings:</p> <ul style="list-style-type: none"> Centre Frequency: 2 484 MHz Span: Hz Resolution BW: 1 MHz Filter mode: Channel filter Video BW: 3 MHz Detector Mode: RMS Trace Mode: Max Hold Sweep Mode: Continuous Sweep Points: Sweep Time [s] / (1 μs) or 5 000 whichever is greater Trigger Mode: Video trigger |

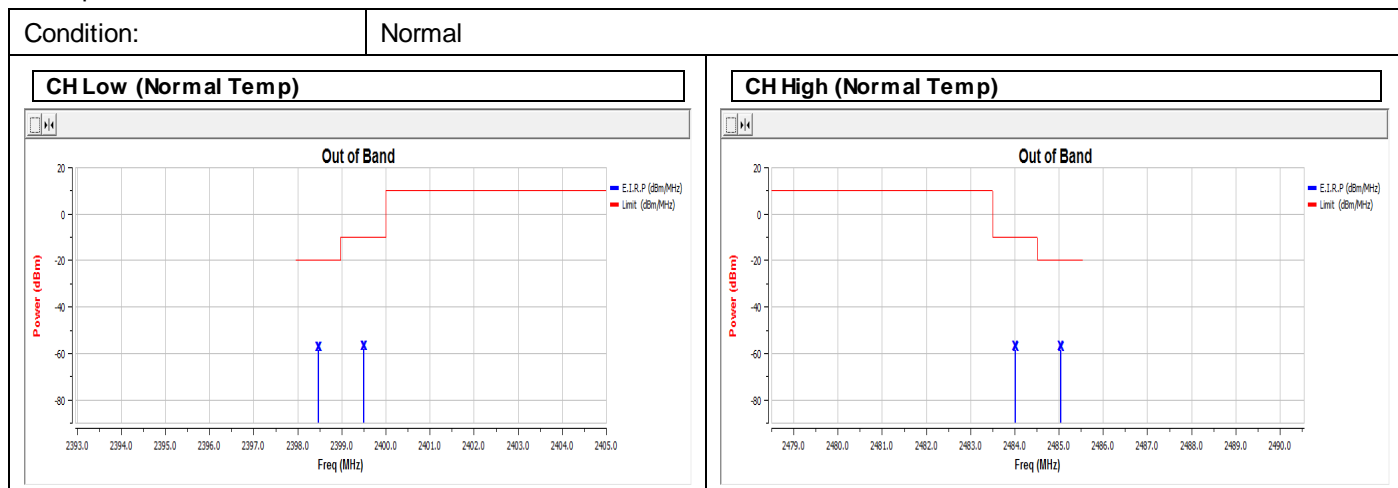

| | |
|--|--|
| | <p>NOTE 1: In case video triggering is not possible, an external trigger source may be used.</p> <p>Sweep Time: >120 % of the duration of the longest burst detected during the measurement of the RF Output Power</p> <p>Step 2: (segment 2 483,5 MHz to 2 483,5 MHz + BW)</p> <p>Adjust the trigger level to select the transmissions with the highest power level.</p> <p>For frequency hopping equipment operating in a normal hopping mode, the different hops will result in signal bursts with different power levels. In this case the burst with the highest power level shall be selected.</p> <p>Set a window (start and stop lines) to match with the start and end of the burst and in which the RMS power shall be measured using the Time Domain Power function.</p> <p>Select RMS power to be measured within the selected window and note the result which is the RMS power within this 1 MHz segment (2 483,5 MHz to 2 484,5 MHz). Compare this value with the applicable limit provided by the mask.</p> <p>Increase the centre frequency in steps of 1 MHz and repeat this measurement for every 1 MHz segment within the range 2 483,5 MHz to 2 483,5 MHz + BW. The centre frequency of the last 1 MHz segment shall be set to 2 483,5 MHz + BW - 0,5 MHz (which means this may partly overlap with the previous 1 MHz segment).</p> <p>Step 3: (segment 2 483,5 MHz + BW to 2 483,5 MHz + 2BW)</p> <p>Change the centre frequency of the analyser to 2 484 MHz + BW and perform the measurement for the first 1 MHz segment within range 2 483,5 MHz + BW to 2 483,5 MHz + 2BW. Increase the centre frequency in 1 MHz steps and repeat the measurements to cover this whole range. The centre frequency of the last 1 MHz segment shall be set to 2 483,5 MHz + 2 BW - 0,5 MHz. (which means this may partly overlap with the previous 1 MHz segment).</p> <p>Step 4: (segment 2 400 MHz - BW to 2 400 MHz)</p> <p>Change the centre frequency of the analyser to 2 399,5 MHz and perform the measurement for the first 1 MHz segment within range 2 400 MHz - BW to 2 400 MHz. Reduce the centre frequency in 1 MHz steps and repeat the measurements to cover this whole range. The centre frequency of the last 1 MHz segment shall be set to 2 400 MHz - BW + 0,5 MHz (which means this may partly overlap with the previous 1 MHz segment).</p> <p>Step 5: (segment 2 400 MHz - 2BW to 2 400 MHz - BW)</p> <p>Change the centre frequency of the analyser to 2 399,5 MHz - BW and perform the measurement for the first 1 MHz segment within range 2 400 MHz - 2BW to 2 400 MHz - BW. Reduce the centre frequency in 1 MHz steps and repeat the measurements to cover this whole range. The centre frequency of the last 1 MHz segment shall be set to 2 400 MHz - 2BW + 0,5 MHz. (which means this may partly overlap with the previous 1 MHz segment).</p> <p>Step 6:</p> <p>In case of conducted measurements on equipment with a single transmit</p> |
|--|--|

| | |
|---------------------|---|
| | <p>chain, the declared antenna assembly gain "G" in dBi shall be added to the results for each of the 1 MHz segments and compared with the limits provided by the mask given in figures 1 or 3. If more than one antenna assembly is intended for this power setting, the antenna with the highest gain shall be considered.</p> <p>In case of conducted measurements on smart antenna systems (equipment with multiple transmit chains), the measurements need to be repeated for each of the active transmit chains. The declared antenna assembly gain "G" in dBi for a single antenna shall be added to these results. If more than one antenna assembly is intended for this power setting, the antenna with the highest gain shall be considered. Comparison with the applicable limits shall be done using any of the options given below:</p> <p>Option 1: the results for each of the transmit chains for the corresponding 1 MHz segments shall be added. The additional beamforming gain "Y" in dB shall be added as well and the resulting values compared with the limits provided by the mask given in figure 1 or figure 3.</p> <p>Option 2: the limits provided by the mask given in figure 1 or figure 3 shall be reduced by $10 \times \log_{10}(A_{ch})$ and the additional beamforming gain "Y" in dB. The results for each of the transmit chains shall be individually compared with these reduced limits.</p> <p>NOTE 2: A_{ch} refers to the number of active transmit chains.</p> <p>It shall be recorded whether the equipment complies with the mask provided in figure 1 or figure 3.</p> |

| |  | | | | | | | | | | | | |
| <p>Test procedure:</p> | <p>1. Pre-scan</p> <p>The test procedure below shall be used to identify potential unwanted emissions of the UUT.</p> <p>Step 1:</p> <p>The sensitivity of the spectrum analyser should be such that the noise floor is at least 12 dB below the limits given in tables 1 or 4.</p> <p>Step 2:</p> <p>The emissions over the range 30 MHz to 1 000 MHz shall be identified.</p> <p>Spectrum analyser settings:</p> <table border="0"> <tr> <td>Resolution BW:</td><td>100 kHz</td></tr> <tr> <td>Video BW</td><td>300 kHz</td></tr> <tr> <td>Filter type:</td><td>3 dB (Gaussian)</td></tr> <tr> <td>Detector mode:</td><td>Peak</td></tr> <tr> <td>Trace Mode:</td><td>Max Hold</td></tr> <tr> <td>Sweep Points:</td><td>≥19 400</td></tr> </table> <p>NOTE 1: For spectrum analysers not supporting this high number of sweep points, the frequency band may need to be segmented.</p> <p>Sweep time:</p> <p>For non continuous transmissions (duty cycle less than 100 %), the sweep time shall be sufficiently long, such that for each 100 kHz frequency step, the measurement time is greater than two transmissions of the UUT.</p> <p>For Frequency Hopping equipment operating in a normal operating (hopping not disabled) mode, the sweep time shall be further increased to capture multiple transmissions on the same hopping frequency in different hopping sequences.</p> <p>NOTE 2: The above sweep time setting may result in long measuring times in case of frequency hopping equipment. To avoid such long measuring times, an FFT analyser could be used.</p> <p>Allow the trace to stabilize. Any emissions identified during the sweeps above and that fall within the 6 dB range below the applicable limit or above, shall be individually measured using the procedure in clause 5.3.10.2.1.3</p> | Resolution BW: | 100 kHz | Video BW | 300 kHz | Filter type: | 3 dB (Gaussian) | Detector mode: | Peak | Trace Mode: | Max Hold | Sweep Points: | ≥19 400 |
| Resolution BW: | 100 kHz | | | | | | | | | | | | |
| Video BW | 300 kHz | | | | | | | | | | | | |
| Filter type: | 3 dB (Gaussian) | | | | | | | | | | | | |
| Detector mode: | Peak | | | | | | | | | | | | |
| Trace Mode: | Max Hold | | | | | | | | | | | | |
| Sweep Points: | ≥19 400 | | | | | | | | | | | | |

| | | | | | | | | | | | | | |
|----------------|--|----------------|-------|----------|-------|--------------|-----------------|----------------|------|-------------|----------|---------------|----------|
| | <p>and compared to the limits given in table 1 or table 4.</p> <p>Step 3: The emissions over the range 1 GHz to 12,75 GHz shall be identified. Spectrum analyser settings:</p> <table> <tr> <td>Resolution BW:</td><td>1 MHz</td></tr> <tr> <td>Video BW</td><td>3 MHz</td></tr> <tr> <td>Filter type:</td><td>3 dB (Gaussian)</td></tr> <tr> <td>Detector mode:</td><td>Peak</td></tr> <tr> <td>Trace Mode:</td><td>Max Hold</td></tr> <tr> <td>Sweep Points:</td><td>≥ 23 500</td></tr> </table> <p>NOTE 3: For spectrum analysers not supporting this high number of sweep points, the frequency band may need to be segmented.</p> <p>Sweep time: For non continuous transmissions (duty cycle less than 100 %), the sweep time shall be sufficiently long, such that for each 1 MHz frequency step, the measurement time is greater than two transmissions of the UUT.</p> <p>For Frequency Hopping equipment operating in a normal operating (hopping not disabled) mode, the sweep time shall be further increased to capture multiple transmissions on the same hopping frequency in different hopping sequences.</p> <p>NOTE 4: The above sweep time setting may result in long measuring times in case of frequency hopping equipment. To avoid such long measuring times, an FFT analyser could be used.</p> <p>Allow the trace to stabilize. Any emissions identified during the sweeps above that fall within the 6 dB range below the applicable limit or above, shall be individually measured using the procedure in clause 5.3.10.2.1.3 and compared to the limits given in table 1 or table 4.</p> <p>Frequency Hopping equipment may generate a block (or several blocks) of spurious emissions anywhere within the spurious domain. If this is the case, only the highest peak of each block of emissions shall be measured using the procedure in clause 5.3.10.2.1.3.</p> <p>Step 4: In case of conducted measurements on smart antenna systems (equipment with multiple transmit chains), the steps 2 and 3 need to be repeated for each of the active transmit chains (Ach). The limits used to identify emissions during this pre-scan need to be reduced with $10 \times \log_{10}$ (Ach) (number of active transmit chains).</p> <p>2. Measurement of the emissions identified during the pre-scan The steps below shall be used to accurately measure the individual unwanted emissions identified during the pre-scan measurements above. This method assumes the spectrum analyser has a Time Domain Power function.</p> <p>Step 1: The level of the emissions shall be measured using the following spectrum</p> | Resolution BW: | 1 MHz | Video BW | 3 MHz | Filter type: | 3 dB (Gaussian) | Detector mode: | Peak | Trace Mode: | Max Hold | Sweep Points: | ≥ 23 500 |
| Resolution BW: | 1 MHz | | | | | | | | | | | | |
| Video BW | 3 MHz | | | | | | | | | | | | |
| Filter type: | 3 dB (Gaussian) | | | | | | | | | | | | |
| Detector mode: | Peak | | | | | | | | | | | | |
| Trace Mode: | Max Hold | | | | | | | | | | | | |
| Sweep Points: | ≥ 23 500 | | | | | | | | | | | | |

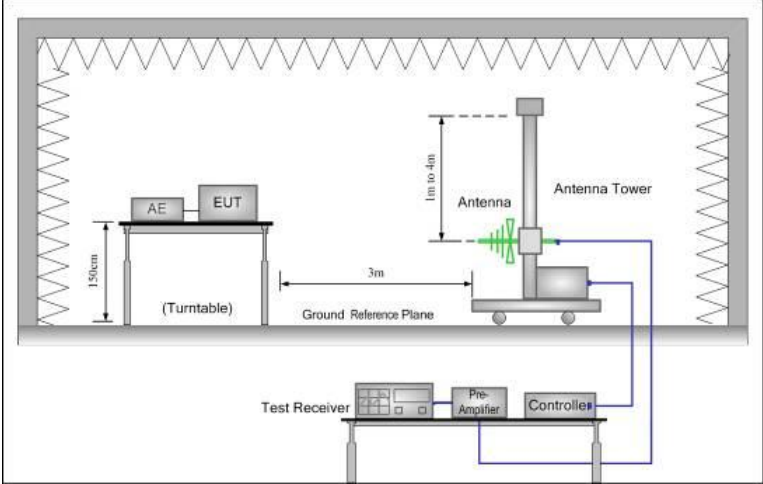

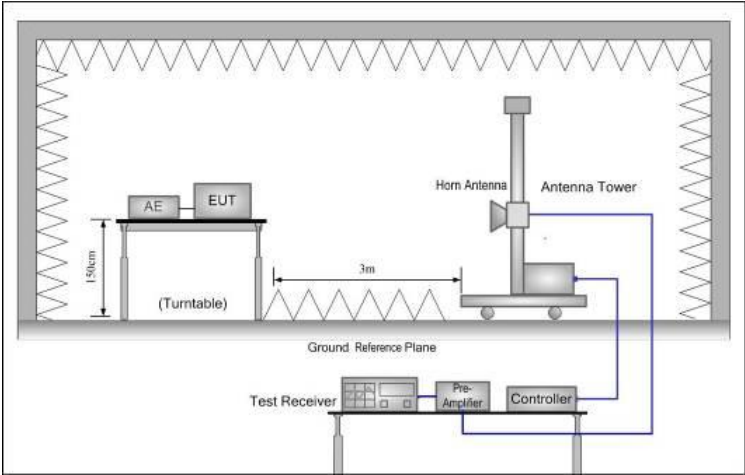

| | |
|---------------------|--|
| | <p>analyser settings:</p> <p>Measurement Mode: Time Domain Power</p> <p>Centre Frequency: Frequency of emission identified during the pre-scan</p> <p>Resolution BW: 100 kHz (< 1 GHz) / 1 MHz (> 1 GHz)</p> <p>Video BW 300 kHz (< 1 GHz) / 3 MHz (> 1 GHz)</p> <p>Frequency Span: Zero Span</p> <p>Sweep mode: Single Sweep</p> <p>Sweep time: 30 ms</p> <p>Sweep points: >=30 000</p> <p>Trigger: Video (burst signals) or Manual (continuous signals)</p> <p>Detector: RMS</p> <p>Step 2: Set a window where the start and stop indicators match the start and end of the burst with the highest level and record the value of the power measured within this window. If the spurious emission to be measured is a continuous transmission, the measurement window shall be set to match the start and stop times of the sweep.</p> <p>Step 3: In case of conducted measurements on smart antenna systems (equipment with multiple transmit chains), step 2 needs to be repeated for each of the active transmit chains (Ach). Sum the measured power (within the observed window) for each of the active transmit chains.</p> <p>Step 4: The measured values shall be compared to the limits defined in tables 1 and 4.</p> |
